Notes: N=1444 (722 CZ x 2 time periods). Outcomes in panels A, B and D consider adult women ages 18-39 while those in panels C and E consider children ages 0-17. Fertility in column B4 is measured through 2016 while all other outcomes are measured through 2014. Dependent variables are: fraction of women with any biological, adopted, or stepchildren in the household (B5); fraction currently married among women with children in the household (B6); the fraction of children in households below the official Census poverty line (C7). Columns D1 and D2 refer to households where either (1) the woman is the spouse or partner of the household head or (2) she is the household head and has a spouse or partner who is living in the household. Column D3 comprises all other household structures. Dependent variables in columns E4-E7 are the fraction of children in each household type: household head is a married parent of the child (E4); household head is a parent with cohabiting partner (E5); household head is a single parent (E6); or household head is a grandparent, other relative, or non-related caregiver (E7). All regressions include the full set of control variables from Table 1, are weighted by the product of period length and CZ population share, and standard errors are clustered on state. ~ $p \leq 0.10$, * $p \leq 0.05$, ** $p \leq 0.01$.
